CLAIMS

What is claimed is:

15

20

25

5 1. A method for reducing the formation of biofilm deposits on a wall in a water system comprising the steps of:

providing a capacitive electrostatic generator adapted to create an electrostatic field;

immersing said electrostatic generator in a body of water in
the water system, the water system being connected to an
electrical ground relative to an electromotive force available
for energizing the electrostatic generator; and

energizing said electrostatic generator with said electromotive force, such that a corresponding electrostatic field is created between said generator immersed in the water system and said electrical ground without measurable current leakage in the body of water;

wherein said capacitive electrostatic generator comprises a vitrified ceramic tube of unibody construction having an integrally-sealed end defining an inner cavity with an inner wall; conductive material contained within said inner cavity and disposed in intimate contact with said inner wall; electrically-insulated sealing means for providing hermetic closure to said inner cavity; and electrical means for energizing said conductive material with a static electromotive force.

- 2. The method of Claim 1, wherein said voltage is greater than about 10,000 volts DC.
- 5 3. The method of Claim 1, wherein said voltage is greater than about 30,000 volts DC.
